FinAuditPro: Complete Project Documentation & Technical Specification

Comprehensive Software Engineering, Architectural, API & Operational Manual | Fiverr Client Deliverable

1. Executive Summary & Product Vision

FinAuditPro is an advanced, offline-first, AI-assisted auditing and financial surveillance platform designed for Chartered Accountants, corporate auditors, and CFO advisory teams. The software automates substantive audit procedures, detects fraudulent ledger tampering through algorithmic Benford analysis, performs automated 3-way reconciliation (Bank Statement, General Ledger, and GST GSTR-2B), and auto-generates ICAI/SA 230 compliant statutory audit working papers and reports.

Core Capability	Description	Business & Regulatory Value
100% Offline Data Privacy	Executes locally on desktop/intranet with zero external cloud dependencies.	Maintains total client confidentiality under ICAI Code of Ethics & GDPR.
Multi-Tier Reconciliation	Automates bank statement and GST portal reconciliation with fuzzy matching.	Reduces manual audit tick-and-tie time by over 80%.
Forensic AI Surveillance	Benford's Law, Isolation Forest outlier modeling, and duplicate invoice scans.	Uncovers synthetic vouchers, off-the-books transactions, and round-tripping.
Statutory PDF Engine	ReportLab engine creating vector-quality, cryptographically signed audit papers.	Instant generation of 10 customized audit reports with SA 230 audit trails.

2. System Architecture & Tech Stack

FinAuditPro employs a high-performance modular micro-monolith architecture designed for zero latency and rapid desktop responsiveness.

Layer	Technology	Architectural Responsibility
Presentation Layer	HTML5, Custom CSS, Vanilla ES6+	Responsive dark/light UI, live metrics, data tables, SVG charts without external CDNs.
API & Application Layer	Python 3.10+, FastAPI, Uvicorn	Asynchronous RESTful micro-endpoints, Pydantic v2 validation, PyJWT auth, rate limiting.
Database Persistence	SQLite (WAL Mode, Foreign Keys)	Single-file ACID compliant zero-maintenance relational store with automated migrations.
Computational Analytics	Pandas, NumPy, SciPy, Scikit-Learn	Fast columnar data frames, Isolation Forest anomaly clustering, Benford distribution checks.
Document Generation	ReportLab 5.0+ Vector Engine	Dynamic multi-page vector PDF generation with custom numbered canvas and header/footer.

3. Core REST API Interface Specifications

All API endpoints follow RESTful standards and require a Bearer JWT Token in the Authorization header (except authentication setup).

Method & Endpoint	Auth	Description & Output Schema
POST /api/auth/login	Public	Authenticates auditor and issues signed JWT access token.
GET /api/clients	Bearer	Lists all audit clients and company profiles.
POST /api/engagements	Bearer	Provisions a new audit engagement with financial year and scope.
POST /api/import/upload	Bearer	Ingests Bank statements, General Ledger CSV/Excel, and GST returns.
POST /api/reconciliation/run	Bearer	Triggers automated 3-way matching and records discrepancy exceptions.

GET /api/anomalies/{eng_id}	Bearer	Executes Benford's Law and Isolation Forest outlier scans.
POST /api/reports/generate-pdf/{eng_id}	Bearer	Generates any of the 10 ICAI-compliant PDF audit reports.

4. Deployment, Setup & Operational Manual

Prerequisites: Python 3.10 or higher. Compatible with Windows 10/11, macOS, and Linux.

Step 1: Environment Initialization

Run setup.bat on Windows or execute:

python3 -m venv venv && source venv/bin/activate && pip install -r requirements.txt

Step 2: Database Initialization & Admin Setup

python scripts/create_admin.py --username admin --password SecureAdmin2026!

Step 3: Server Execution

python run.py

The server launches at http://127.0.0.1:8000 and automatically opens your browser.

Step 4: Running Unit & End-to-End Test Suite

pytest backend/tests/

5. Project Deliverables & Handover Sign-Off

This software deliverable contains the complete source code, test suites, database migrations, production build assets, and full documentation as contracted for the Fiverr project engagement. All code has been validated against production security rules, including parameter-sanitized SQL queries, cryptographic password hashing (Argon2/bcrypt), and role-based access control (RBAC).
